This sequence represents a human fibronectin coding sequence fragment, containing fibrin binding domains. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, fibrin binding regions of human fibronectin, which are from fibrin binding regions of human fibronectin, which are from fibrin ability to bind with fibrin independently and also characteristically retains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable or animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of neural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen activation process to the site of pathological thrombolysis).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         overcomes systemic plasminogen activation encountered during clinical use

This sequence represents a chimeric streptkinase-fibrin binding domain (SK-PBD) protein coding sequence. The invention relates to a hybrid plasminogen activator (PA) comprises a polypeptide fusion between streptokinase (SK), which are capable of plasminogen (PG) activation, and streptokinase (SK), which are capable of plasminogen (PG) activation, and cibrin binding regions of human fibronectin, which are from fibrin binding domains (FBD) 4 and 5 or 1 and 2. The hybrid PA possesses the ability to bind with fibrin independently and also characteristically cretains a PG activation ability which becomes evident only after a pronounced duration, or lag, after exposure of the PA to a suitable comman PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as certain streptokinase in being characterised by a temporary delay, or lag natural streptokinase in being characterised by a temporary delay, or lag contains are objasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating converomes systemic plasminogen activation encountered during clinical use overcomes systemic plasminogen activation to standardise OS field)

present invention describes a new composition comprising an antisense

Disclosure; Page 950-952; 1343pp; English.

oligonuclectide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, antiasthmetic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation,

c impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vas soronstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive culmonary disease (CODD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the construction and inflammation. AAA32313 to AAA35312 represent the roll of the sequences given in the sequence listing from the present cinvention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 2815, but the sequences differ from the previously named sequences. SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:1 to 185, but the sequence of from the present invention. N.B. Sequences given in the disclosure of the present invention. N.B. Sequences given in the disclosure of the present invention on the match of the present invention. Sequence given in the disclosure of the present invention of the present invention. N.B. Sequences given in the disclosure of the present invention and the sequence of the present invention. N.B. Sequences given in the sequences given in the sequences given in the sequences.

ö New polypeptides and polynucleotides having properties related to stimulation of biochemical or physiological responses in a cell or tissue, useful for diagnosing or preventing e.g. atherosclerosis, hypertension, prostate cancer.

Claim 20; Page 105-107; 849pp; English.

The invention relates to an isolated polypeptide comprising one of 127 sequences (appearing as ABO1288-ABO1414) designated as NOVX, a mature form of NOVX an amino acid sequence which is at least 95% identical to NOVX or an amino acid sequence comprising one or more conservative substitutions in NOVX. Also included are nucleic acids encoding NOVX creamining the presence or amount of NOVX or NOVY DNA in a sample (by introducing the sample to an antibody that binds immunospecifically to the polypeptide, and determining the presence or amount of antibody bound to the polypeptide, determining the presence of contraction of antibody bound to the polypeptide, determining the presence of amount of antibody bound to the polypeptide, determining the presence of contraction of NOVX DNA in a first mammalian subject, identifying a potential therapoutic agent care agent that binds to NOVX, identifying a potential therapoutic agent for treatment of a pathology related to aberrant expression or aberrant physiological interactions of NOVX, screening for a modulator of activity of or or flatency or predisposition to a pathology associated with NOVX, a vector comprising NOVX DNA, a cell comprising the vector (used to produce NOVX) and an anti-NOVX antibody. The NOVX nucleic acids and polypeptides are useful as a marker for cell or tissue type, and in diagnosing and

```
NOVX sequences, including cardiomyopathy, atherosclerosis, hypertension, congenital heart defects, prostate cancer, diabetes, metabolic disorders, neoplasm, graft versus host disease, AIDS, bronchial asthma, Crohn's disease, multiple sclerosis, infectious diseases, anorexia, cancerassociated cachexia, neurodegenerative disorders (e.g. Alzheimer's disease or Parkinson's disease), immune disorders, haematopoietic diseases. These may also be used to screen for molecules which inhibit or enhance NOVX activity or function, and for detecting specific cell types. These may also be used in chromosome mapping, gene therapy, tissue typing, and in forensic biology. The present sequence encodes a NOVX

```
The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lession in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, ancexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           133
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      TyrGluArgProLysAspSerMetlleTrpAspCysThrCysIleGlyAlaGlyArgGly 100

                                                                                                                                                                        ·
                                                                                                                                                                                                                                                                                   The invention discloses a method for determining whether a compound can be used to treat prostate cancer call sample in the presence level of a mutalic acid in prostate cancer call sample in the presence and absence of the compound. Determining whether a compound can be used to treat prostate cancer centermining whether a compound can be used to treat prostate cancer treatment when the expression level of the nucleic acid in the absence of the compound. Prostate cancer is usually concern and analysis of anti-androgen withdrawal, by castration or through the use of an anti-androgenic darig bicalutamide (casodex) is one such anti-androgenic compound or testosterone, can be used to treat the prostate cancer can be made on a patient by patient basis. The sequence presented is a gene which is more highly expressed in testosterone treated prostate cancer calls than the untreated calls.
                                                                                                                                                                                               Determination of whether compound is useful for prostate cancer treatment comprises measuring expression level of specific nucleic acid sequence in prostate cancer cell sample in the presence and absence of compound.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors bradykinin receptors, central nervous system (CKS) and peripheral nervous and non-nervous system receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders and or the factors, vasoactive peptides and continuing respiratory obstruction (especially pulmonary obstruction) and/or hyporhemory obstruction (especially pulmonary obstruction) and/or hyporhemory.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactant hypoproduction which are associated with a disease or condition selected from pulmonary vasobstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome

The present invention describes the human Zmaxl gene and the high bone mass (HBM) gene, which are found on chromosome 11q13.3. The Zmaxl and HBM genes have osteopathic activities. The genes can be used in gene therapy, antisense therapy and in the production of vaccines. They can be used in the diagnosis and treatment of bone disorders including osteoporosis, paget's disease, sclerostosis, osteomalacia and fibrous dysplasia.

ABAR2038 to ABA82700 and AAG68188 to AAG68193 represent sequences used in the exemplification of the present invention

The present invention describes a method (M1) for screening for an antinoplastic agent. The method involves exposing cells to a chemical agent conclusion of a large in activity, determining a change in expression of at least one gene (1) of a signature gene set, where (1) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises a sequence (S) selected from 8447 sequences (given in ABL61664 comprises in at least 95% identical to (S); where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of M1, and the data is sufficient to convey the chemical structure and/or properties of the agent. M1 can be used in the treatment of cancer such properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, oesophageal, ovarian, kidney, prostate or pancreatic cancer, adence, infiltrating lobular cancer, squamous
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Screening for anti-neoplastic agent involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, and determining a change in expression of a gene of a signature gene set.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Horrigan S;

patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABT09867-
ABT11112, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients. The methods are also useful as a screening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be used as diagnostic markers for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              253

The present invention describes a method for inhibiting angiogenesis in a tissue comprising providing a tissue and an agent that inhibits specific tissue comprising providing a tissue and an agent that inhibits specific binding of integrin alpha4betal to an integrin alpha4betal ligand, and treated treated the tissue with the agent under conditions where the specific binding of the alpha4betal to the ligand is inhibited and a treated tissue is produced. Apploagnesis in the treated tissue is inhibited. Also described: (1) inhibiting endothelial cell adhesion or migration; (2) detecting angiogenesis in a tissue; (3) screening a test compound; (4) is an ocular or skin tissue. An integrin alpha4betal binding inhibitor is an ocular or skin tissue. An integrin alpha4betal binding inhibitor and subject, or a pathological condition, and dermatological activities, and can be used in gene therapy. The methods are useful for treating cancer, and correspathic cancer, such as diabetic retinopathy, macular degeneration by neovascularisation, rheumatoid arthritis, osteoarthritis, psoriasis or skin cancer. The methods are also useful in isolating condition and in determining the mechanisms that underlie angiogenesis, development, wound healing and the function of the female reproductive system: The present invention

The invention describes genes (I) which are differentially regulated in prostate cancer. (I) Is useful for diagnosing a prostate cancer in a sample comprising prostate tissue, which involves determining the number of target genes which are differentially-regulated in the sample, where the rumber is indicative of the probability that the sample comprises the number of target genes which are differentially that the sample comprises intervention in a subject having a prostate cancer, which involves interventing the expression levels in a sample comprising prostate cancer. Of target genes which are differentially-regulated in prostate cancer. Perferably, the expression levels of at least 10 genes are determined. (I) is also useful for identifying agents that modulate a biological activity of a polypeptide differentially-regulated in prostate cancer cells with a test agent under conditions effective for the test agent to modulate a biological activity. (I) is useful as molecular markers, as drug targets, and for detecting, determining whether the test agent modulates the biological activity. (I) is useful as molecular markers, assersing, monitoring, presence of cancer conditions especially relating to prostate cancer. (I) and its expression products are used in the diagnostic test to assay for presence of cancer e.g., in tissue sections, in biopsy sample, in total RNA, in lymph, in clood etc. (I) is useful propredictioner e.g., to determine the type concer, its stage of development, the nature of genetic defect, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel genes which are differentially regulated in prostate cancer, useful for diagnosing prostate cancer in prostate tissue sample and assessing therapeutic or preventive intervention in prostate cancer patients.

The polypeptide encoded by (I) can be used as target for therapy or drug discovery. (I) can also be used for expressing the polypeptide and thus for searching specific binding partners of the polypeptide. (I) is useful in therapeutic applications to treat prostate cancer. The identification of specific genes, and groups of genes, expressed in pathways of physiologically relevant to prostate cancer permits the definition of functional and disease pathways and the delineation of targets in these pathways which are useful in diagnostic, therapeutic, and clinical applications. This sequence encodes a protein diferentially regulated in

The invention relates to novel transgenic animals expressing the high bone mass (HBM) gene, expressing the corresponding wild type HBM gene, comprising an alteration of the gene encoding LRP5 or LRP6, or expressing an LRP5 that is modulated by an altered gene control sequence introduced an LRP5 that is modulated by an altered gene control sequence introduced by homologous or non-homologous recombination. The transgenic animals are for the study of bone density modulation or bone mass modulation. The invention may have a use in gene therapy. The transgenic animals and nucleic acids are for the study of bone density modulation, where the come mass is modulated relative to non-transgenic animals of the same concerning in more than one parameter selected from bone density, bone strength, trabecular number, bone size, or bone tissue connectivity. The transgenic animals, nucleic acids and methods are useful for identifying molecules involved in bone development, and for developing pharmaceutical compositions, which may be employed for treating or preventing bone diseases, e.g. osteoporosis, osteomalacia, rickets, Paget's disease, or neoplasms of the bone. The transgenic animals and nucleic acids are also useful in methods for diagnosing diseases involved in bone development, or characterised by reduced bone density or mass. The present sequence is used in the exemplification of the invention

A higher level of expression of (1) than normal indicates the presence of cervical cancer. Also described: (1) a sessing ((1)) containing (1); and assessing ((1)) containing (1); and assessing ((1)) whether a patient is afflicted with cervical cancer, comprising comparing the level of expression of a marker in a patient's sample, and the normal level of expression of a marker in a patient's cervical cancer sample, where a significant increase in the level of expression of the marker in the patient's sample relative to that in the control sample is an indication that the patient is afflicted with cervical cancer. (1) has cytostatic activity, and can be used in gene therapy and in vaccines. (1) is useful in detecting, cancersising, preventing and treating human cervical cancers. (1) may also be used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        preventing and treating human cervical cancers, in various prognostic and diagnostic assays, in pharmacogenomics and in monitoring clinical trials.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This is the 5' sequence of the clone insert

This is the 5' sequence of the clone insert

Clone from 5. Wiemann, Molecular Genome Analysis, German Cancer

Research Center (DKPZ); Email 8. Wiemann@dkfz- heidelberg.de;

sequenced by Qiagen (Hilden/Germany) within the cDNA sequencing

consortium of the German Genome Project.

No 81 sequence available.

This clone (DKPZp6869033) is available at the RZPD in Berlin.

Please contact the RZPD: Ressourcenzentrum, Heubnerweg 6, 14059

1st strand cDNA was primed with a NotI-oligo(dT) primer. Five prime end enriched, double-strand cDNA was digested with Not I and cloned into the Not I and EcoR V sites of the pCMVSPORT & vector. Library was normalized. Library was constructed by Life Technologies, a division of Invitrogen. This sequence belongs to sequence cluster
                                                                                                                                                                                                                                                                                                                                                                                         D mRNA linear EST 29-APR-2004

Patent No. 6607879
GENERAL INFORMATION:
APPLICANT: Cocks, Benjamin G.
APPLICANT: Susan G. Stuart
APPLICANT: Geffrey J. Sellhamer
TITLE OF INVENTION: COMPOSITION FOR THE DETECTION OF BLOOD CELL GENE
TITLE OF INVENTION: EXPRESSION
NUMBER OF SEQUENCES: 1508
CORRESPONDENCE ADDRESS:
ADDRESSEE: INCYTE PHARMACEUTICALS, INC.
STREET: 3174 PORTER DRIVE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SOFTWARE: Word Perfect 6.1 for Windows/MS-DOS 6.2 CURRENT APPLICATION DATA:
